

# **CS425**

# **Computer Systems Architecture**

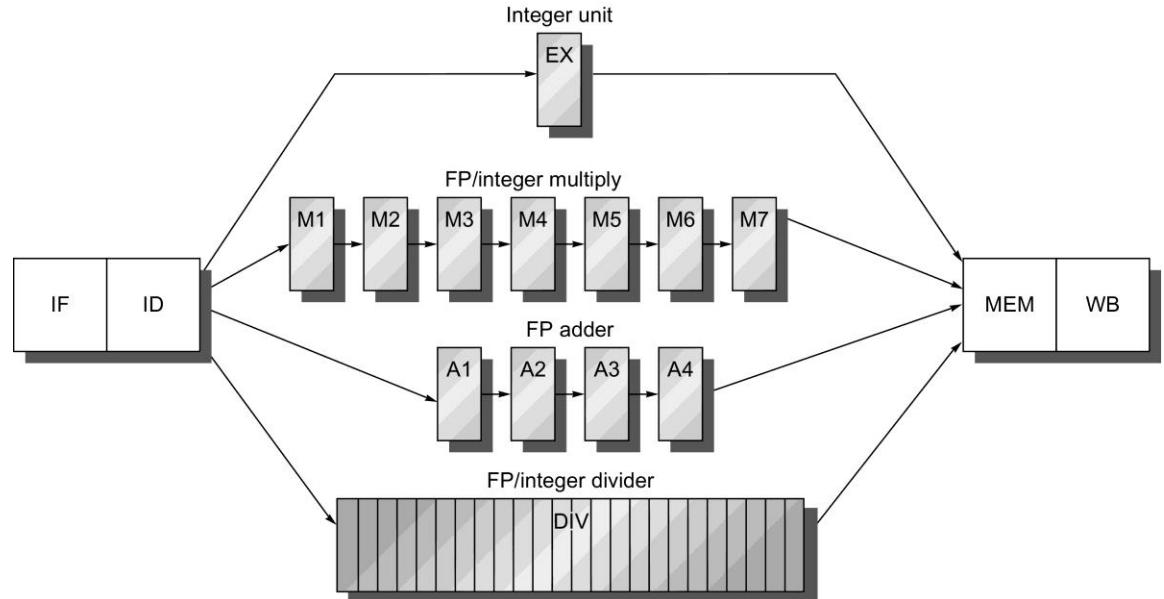

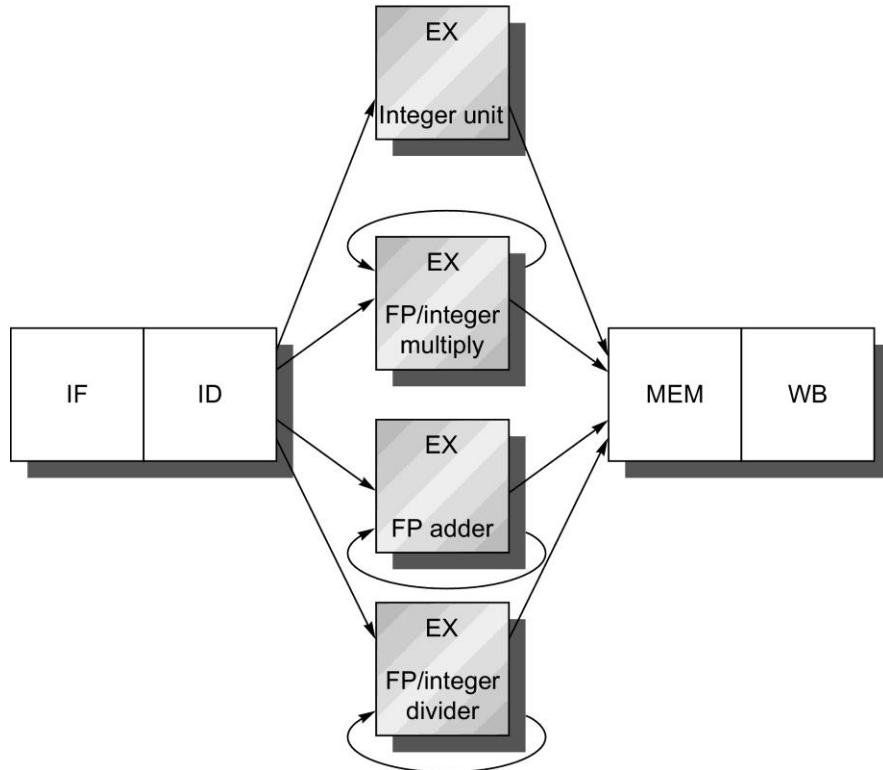

**Fall 2024**

**Dynamic Instruction Scheduling:  
Scoreboard**

# RISC Processor

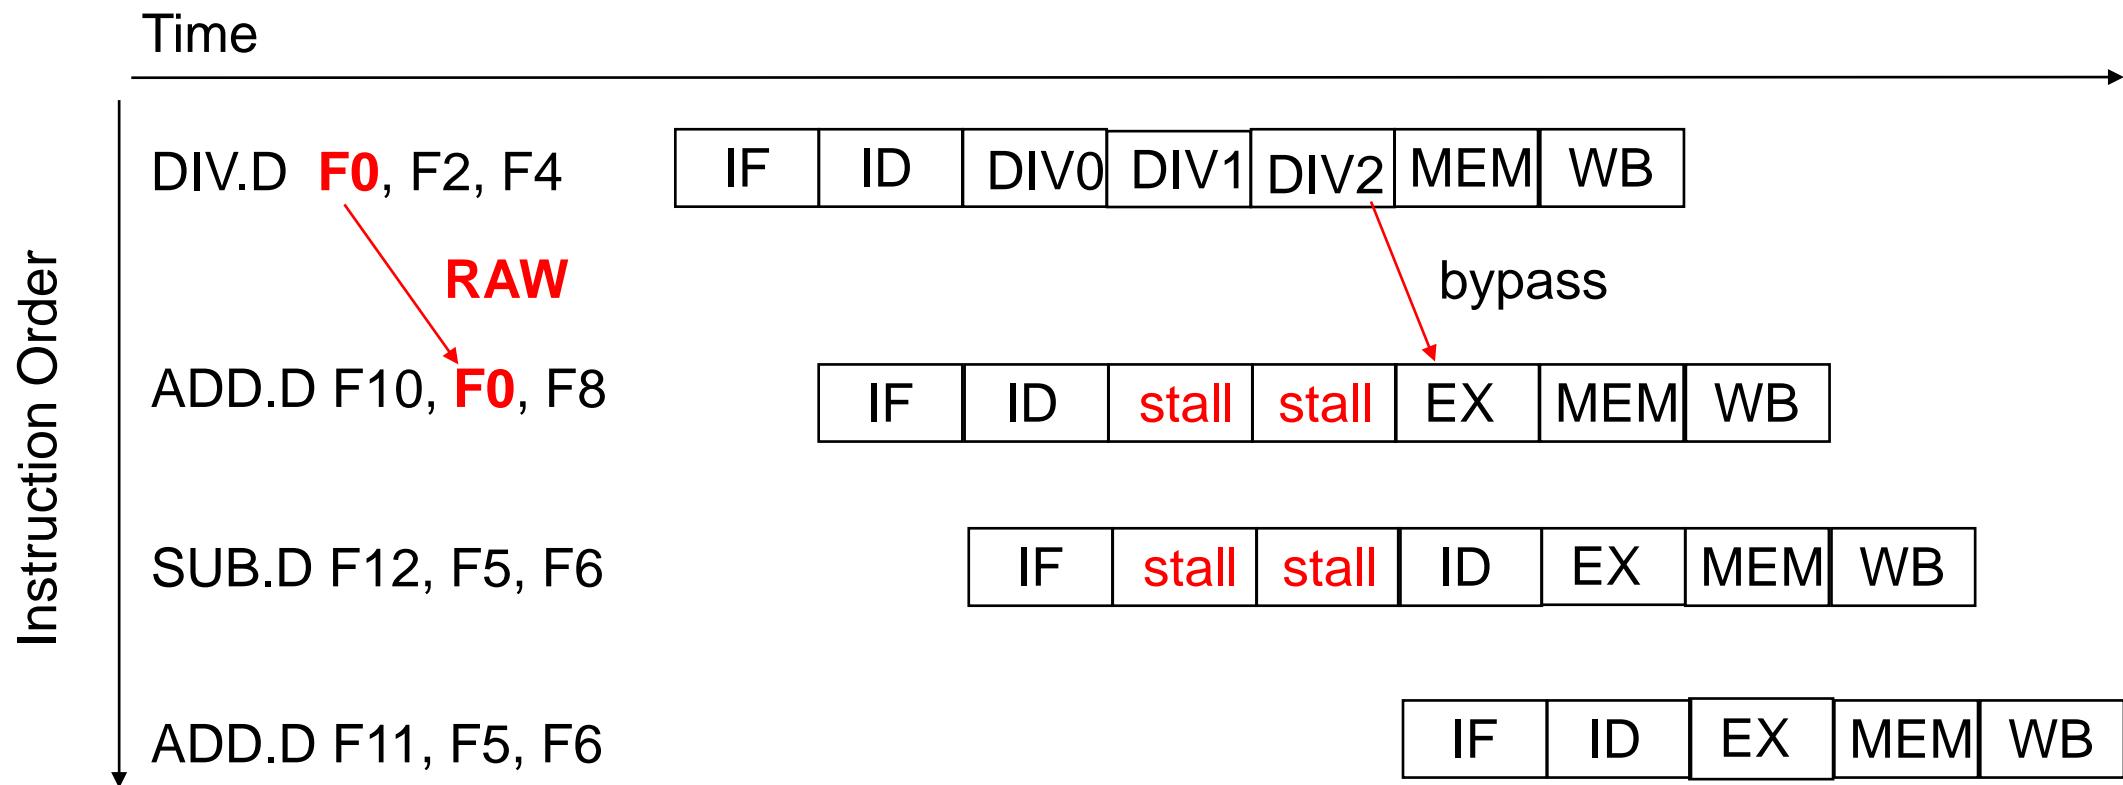

# Pipelines with variable instruction latencies

- FP and multiplication instructions need multiple cycles.
- RISC in-order pipeline does not work efficiently.

# In-order Execution

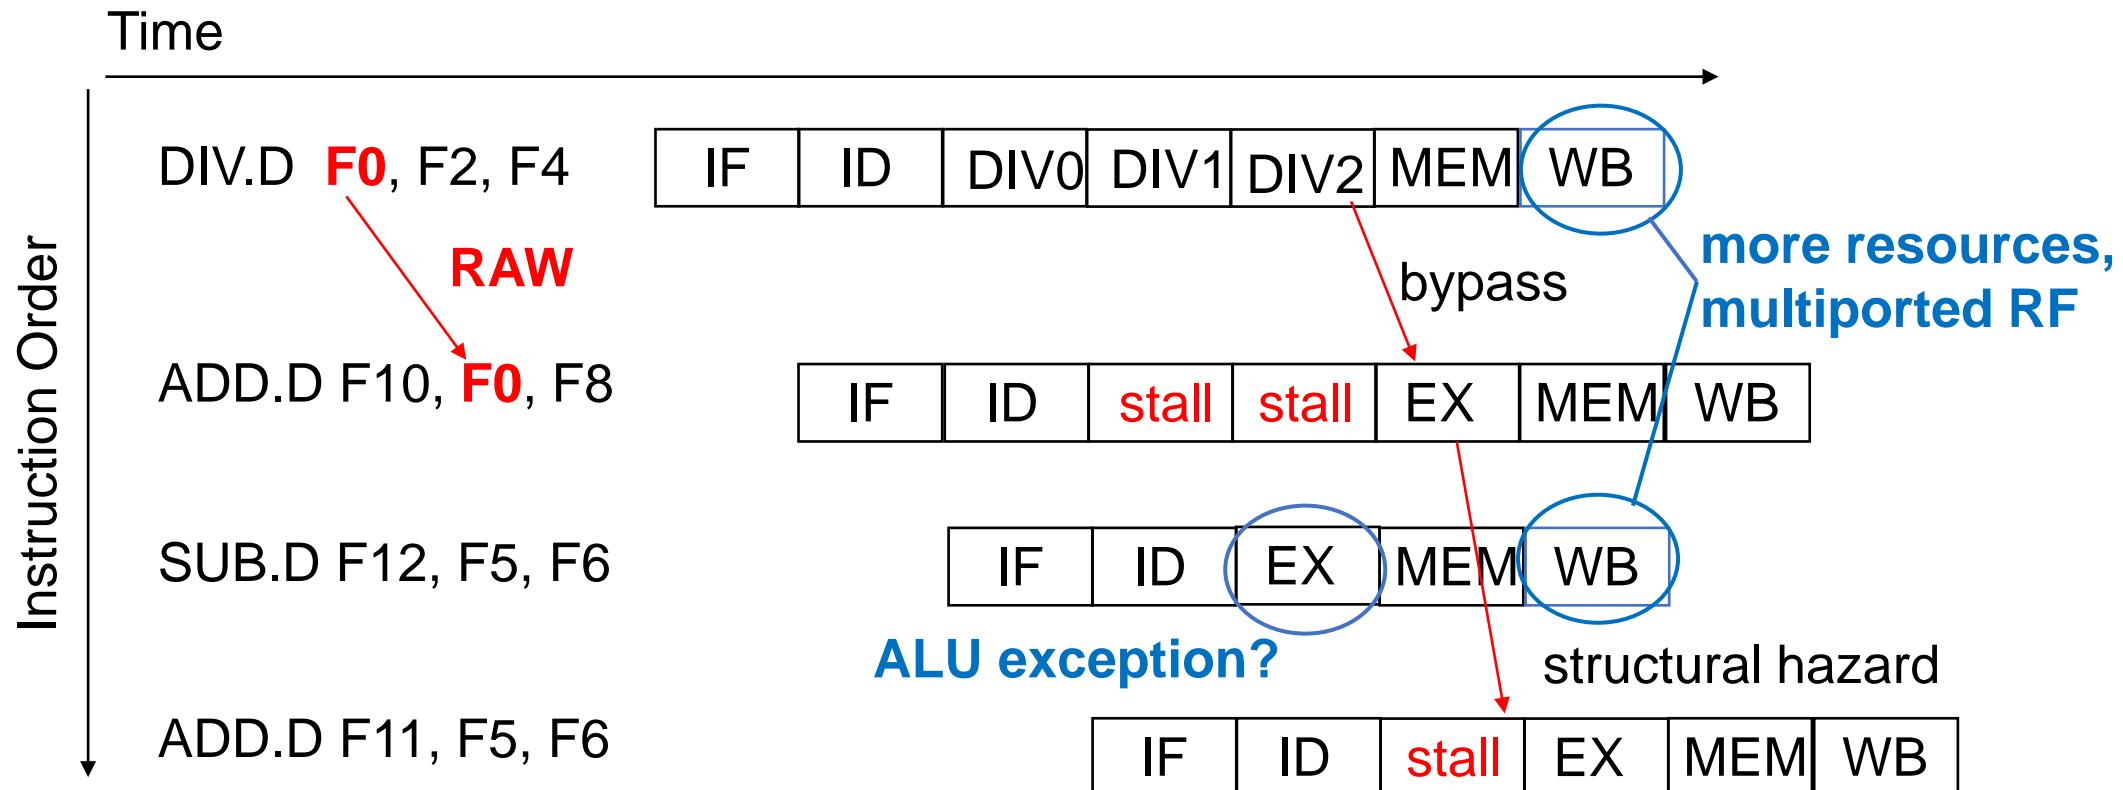

- If DIV takes 10 clock cycles (DIV0, DIV1, ..., DIV9) we need 9 stall cycles

# In-order vs Out-of-order (OoO – O3)

- Execution of a stage **in order**
  - The instructions enter the stage in program order
- Execution of a stage **out of order**
  - No constraint regarding the order the instructions enter the stage
- **Example 1:**
  - in order fetch
  - in order decode
  - out of order execution
  - out of order write back (commit)
- **Example 2:**
  - in order fetch
  - in order decode
  - out of order execution
  - in order write back (commit)

# Out-of-order Execution

- Instructions execute when source operands (registers) values are available and not structural hazards exist
- Even if DIV takes 10 clock cycles the pipeline stalls only for 1 clock cycle

# Instruction Level Parallelism

- **Instruction Level Parallelism (ILP)**
  - Potential overlap among instructions
  - Parallel or out-of-order execution
  - Requires extensions on the simple pipeline
- **Loop Level Parallelism**
  - Exploit ILP between instructions from different basic blocks (e.g iterations of a loop)  
`for (i=1; i<=100; i++) x[i] = x[i] + y[i];`
- **Must maintain:**
  - Data flow: the real flow of values between instructions that write (produce) values and the instructions that read (consume) these values (RAW, WAW, WAR)
  - Exception behavior: changes in execution order should not change the order of exceptions (and should not generate new exceptions)

# Data Flow and Exception Behavior

- **Program Order:** The result of instruction execution should be the same as the sequential execution of the instructions

1. Preserve control dependencies
2. Preserve data flow: preserve data dependencies
3. Exception behavior: changing the order of instruction execution should not create new exceptions

DADDU R2 , R3 , R4

LW R1 , 0 (R2)

execute before branch?

L1 :

# Techniques to reduce stalls

- CPI = Ideal CPI + Structural stalls per instruction + RAW stalls per instruction + WAR stalls per instruction + WAW stalls per instruction
- 1<sup>st</sup> example (in-order) had 2 RAW stalls
- 2<sup>nd</sup> example (out-of-order) has only 1 structural stall
- We will study two types of techniques:

| Dynamic instruction scheduling  | Static instruction scheduling (SW/compiler) |
|---|---|
| Scoreboard (reduce RAW stalls)  | Loop Unrolling                              |
| Register Renaming (reduce WAR & WAW stalls) <ul style="list-style-type: none"><li>• Tomasulo</li><li>• Reorder buffer</li></ul> | SW pipelining                               |
| Branch Prediction (reduce control stalls)   | Trace Scheduling                            |

# Can we use hardware techniques to achieve CPI close to 1?

- Why in hardware during program executions ?
  - It works even if we don't know the real dependencies at compile-time (e.g. memory references).
  - The compiler's job is simpler, otherwise it needs to know all HW details
  - Control dependences
  - The assembly code for a machine can execute well on another machine too.
- **Key idea:** Allow instructions that appear after a stalled instruction to execute (stall only the data dependent instruction)

DIV.D      F0,F2,F4

ADD.D      F10,F0,F8

SUB.D      F12,F8,F14

- Out-of-order execution => out-of-order completion (unless special HW is used)

# Dependencies between Instructions

- What are the sources of stalls/bubbles;
  - instructions that use the same registers
- **Parallel** instructions can execute without imposing any stalls (if we ignore structural hazards)
  - DIV.D F0, F2, F4
  - ADD.D F10, F1, F3
- **Dependencies** between instructions may lead to stalls
  - DIV.D F0, F2, F4
  - ADD.D F10, F0, F3

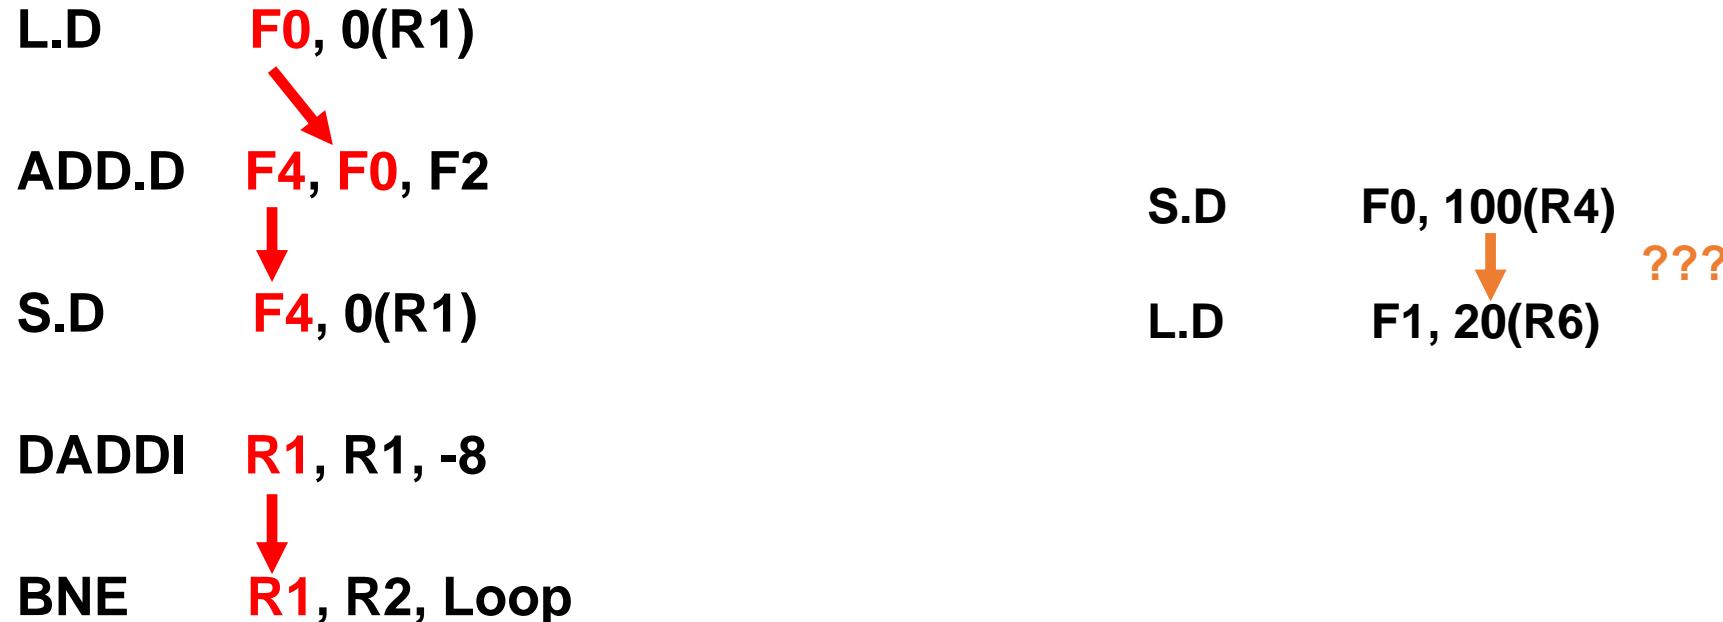

**must enter the execution stage in order**

- The dependencies between instructions limit the order of execution of these instructions (impose in order execution). In the 2<sup>nd</sup> example ADD.D **must** execute after DIV.D has completed. On the other hand, parallel instructions **may** execute in any order (out-of-order execution). In the 1<sup>st</sup> example ADD.D can execute before DIV.D.

# Dependencies between Instructions

- **(True) Data Dependencies** : instructions are data dependent when there is a chain of RAW hazards between them.

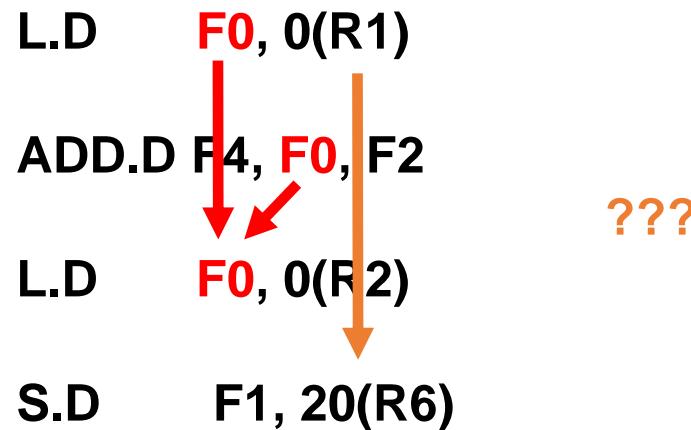

Loop:

*What does this code do?*

# Dependencies between Instructions

- **Name Dependencies** : instructions are name dependent when there is a WAR (anti-dependence) or WAW (output-dependence) hazard between them.

*Spot the anti-dependence!*

- **Control Dependencies** : Instructions dependent via branches.

if p1 { S1; }

# Hazard Issues

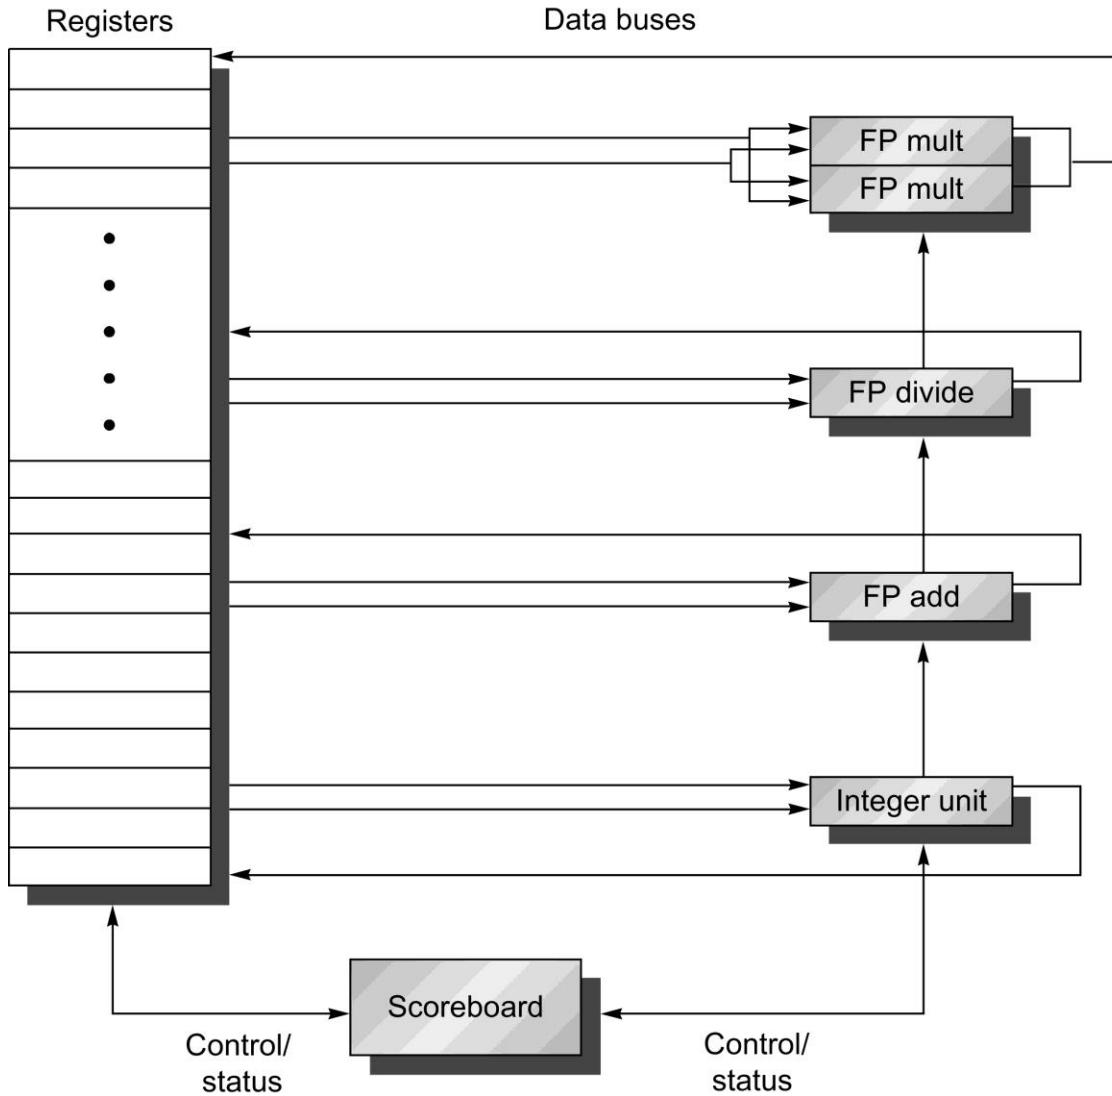

- How do we prevent WAR and WAW hazards?
- How do we handle variable latency execution units?
  - Forwarding for handling RAW hazards is a lot harder!

| Instruction                | Clock Cycle Number |    |    |     |       |    |       |       |       |       |       |       |       |       |     |        |
|----------------------------|--------------------|----|----|-----|-------|----|-------|-------|-------|-------|-------|-------|-------|-------|-----|--------|
|                            | 1                  | 2  | 3  | 4   | 5     | 6  | 7     | 8     | 9     | 10    | 11    | 12    | 13    | 14    | 15  | 16     |
| LD F6,34(R2)               | IF                 | ID | EX | MEM | WB    |    |       |       |       |       |       |       |       |       |     |        |
| LD F2,45(R3)               |                    | IF | ID | EX  | MEM   | WB |       |       |       |       |       |       |       |       |     | RAW    |
| MULTD F0,F2,F4             |                    |    | IF | ID  | stall | M1 | M2    | M3    | M4    | M5    | M6    | M7    | M8    | M9    | M10 | MEM WB |
| SUBD F8, <del>F6</del> ,F2 |                    |    |    | IF  | ID    | A1 | A2    | MEM   | WB    |       |       |       |       |       |     |        |
| DIVD F10,F0,F6             |                    |    |    |     | IF    | ID | stall | D1  | D2     |
| ADDD F6,F8,F2              |                    |    |    |     |       | IF | ID    | A1    | A2    | MEM   | WB    |       |       |       | WAR |        |

# Scoreboard: Out-of-Order Execution

- Split the ID stage into two different stages:
  1. **Issue:** Decode instruction, check for structural hazards. In order instruction issue.
  2. **Read Operands:** Wait until all data hazards are resolved, then read source registers. Out-of-order execution.
- Scoreboard appeared in CDC6600 (1963)
- The instructions execute when they do not depend on previous instructions (which have not been executed yet) and at the same time there are no hazards.
- CDC6600: In order issue, out-of-order execution, out-of-order commit (or completion)
  - 16 functional units: 4 floating-point units, 5 units for memory references, and 7 units for integer operations
  - No forwarding!

# Scoreboard Architecture (CDC 6600)

Instruction to scoreboard  $\Rightarrow$   
data dependences  $\Rightarrow$   
hazard detection and  
resolution centralized

**Scoreboard:** decides when  
the instruction can **execute**  
and when it can **write its  
result**

# Scoreboard Implications

- Out-of-order completion => WAR, WAW hazards?
- Solutions for WAR:
  - Stall register *write-backs* until registers have been read.
  - Read registers only on the **Read Operands** stage
- Solutions for WAW:
  - Detect this hazard and stall the new instruction (no issue) until the previous instruction has completed/executed.
- There is no register renaming!
- Multiple instruction in execution stage => multiple execution units or pipelined execution units
- The Scoreboard keeps information about the dependencies of the instructions that have been issued.
- The Scoreboard-based pipeline replaces the ID stage with 2 stages: **Issue** and **Read Operands**

# Four Stages of Scoreboard Control

- **Issue:** decode instruction & record data dependences & check for structural hazards (ID1)
  - Instructions issued in program order (for hazard checking)
  - Don't issue if **structural hazard**
  - Don't issue if instruction is **output dependent** on any previously issued but uncompleted instruction (no WAW hazards)
- **Read operands:** wait for data hazards to be resolved, then read registers (ID2)
  - All real dependencies (RAW hazards) resolved in this stage, since we wait for instructions to write back data.
  - **No forwarding of data** in this model!

# Four Stages of Scoreboard Control

- **Execution:** execute the instruction on a functional unit (EX)
  - The functional unit begins execution upon receiving operands. When the result is ready, it notifies the scoreboard that it has completed execution.
- **Write result:** End of execution (WB)
  - Stall until there are no WAR hazards with previous instructions:

|                 |       |                   |
|-----------------|-------|-------------------|
| <b>Example:</b> | DIV.D | F0,F2,F4          |
|                 | ADD.D | F10,F0, <b>F8</b> |
|                 | SUB.D | <b>F8</b> ,F8,F14 |

- CDC 6600 scoreboard would stall SUBD until ADDD reads operands
- Instructions write their results into the register file as soon as they complete execution (assuming no WAR hazard)

# Data structure: 3 parts of Scoreboard

- **Instruction status:** In which of the four stages is the instruction
- **Functional unit status:** Indicates the current state of the functional unit (FU). 9 fields per functional unit.

|        |   |
|--------|---|
| Busy:  | Indicates whether the unit is busy or not               |
| Op:    | Operation to perform in the unit (e.g., + or -)         |
| Fi:    | Destination register                                    |
| Fj,Fk: | Source-register numbers                                 |
| Qj,Qk: | Functional units producing source registers Fj, Fk      |
| Rj,Rk: | Flags indicating when Fj, Fk are ready and not yet read |

- **Register result status:** Indicates which functional unit will write each register, if any. Empty when no pending instructions will write that register

# Scoreboard Example

*Instruction status:*

| Instruction | j   | k   | Issue | Read | Exec | Write       |

# CDC 6600 Scoreboard

- Speedup 1.7 for FORTRAN programs; 2.5 by hand (outdated measurements)
- Limitations of 6600 scoreboard:
  - No forwarding hardware
  - Limited to instructions in basic block (small window)
  - Small number of functional units (structural hazards), especially integer/load store units
    - Do not issue on structural hazards
  - Wait for WAR hazards
  - Prevent WAW hazards
